Question 1: Calculating Force Using Newton's Second Law

Suppose an object with a mass of 10 kg accelerates at 3 m/s^2 . What is the force acting on the object?

Solution:

- Identify known values:

- Mass (m) = 10 kg
- Acceleration (a) = 3 m/s^2
- Recall Newton's Second Law:
- $F = ma$
- Calculate force:
- $F = 10 \text{ kg} \times 3 \text{ m/s}^2 = 30 \text{ N}$
- Answer: The force acting on the object is 30 Newtons.

Question 2: Work Done by a Force

If a force of 50 N is used to move an object 5 meters along a straight path, what is the work done? Assume the force is applied in the same direction as the movement.

Solution:

- Known values:
- Force (F) = 50 N
- Distance (d) = 5 m
- Recall the work formula:
- $W = Fd \cos\theta$
- Since the force and movement are in the same direction, $\cos\theta = 1$.
- Calculate work:
- $W = 50 \text{ N} \times 5 \text{ m} \times 1 = 250 \text{ Joules}$
- Answer: The work done is 250 Joules.

Question 3: Energy Conservation in a Falling Object

An object of mass 2 kg is dropped from a height of 20 meters. Assuming no air resistance, what is its speed just before hitting the ground?

Solution:

- Known:
- Mass (m) = 2 kg (not directly needed for velocity)
- Initial height (h) = 20 m
- Acceleration due to gravity (g) = 9.8 m/s²
- Apply conservation of energy:
- Potential energy at the top = Kinetic energy just before impact
- $mgh = \frac{1}{2}mv^2$
- Simplify to find v:
- $v = \sqrt{2gh} = \sqrt{2 \times 9.8 \text{ m/s}^2 \times 20 \text{ m}} = \sqrt{392} \approx 19.8 \text{ m/s}$
- Answer: The object's speed just before hitting the ground is approximately 19.8 m/s.

The answer emphasizes inertia, stating that the passenger's body resists the change in motion, highlighting the importance of seatbelts for safety.

2. Newton's Second Law ($F = ma$)

Explanation:

Students are asked to apply the formula to solve for force, mass, or acceleration, often involving real-world scenarios like calculating the force needed to accelerate a car or the acceleration of a falling object.

Sample problem:

A 10 kg object accelerates at 5 m/s^2 . What is the force applied?

Solution:

Using $F = ma$, we get $F = 10 \text{ kg } 5 \text{ m/s}^2 = 50 \text{ N}$.

Answer significance:

The answer demonstrates proficiency in basic algebra and understanding of units, reinforcing core physics concepts.

3. Friction and its Effects

Explanation:

Questions explore how friction affects motion, including static and kinetic friction, and how surface types influence the force of friction.

Sample question:

?Calculate the force of kinetic friction if the coefficient of kinetic friction is 0.3 and the normal force is 100 N.?

Solution:

$$F_{\text{friction}} = ? \text{ N} = 0.3 \text{ } 100 \text{ N} = 30 \text{ N}.$$

Expert tip:

Understanding how to compute frictional forces helps students predict motion behaviors in various environments.

Explanation:

Problems often involve converting between average speed, instantaneous speed, and understanding acceleration as a change in velocity over time.

Sample question:

?A car travels 150 km in 3 hours. What is its average speed??

Answer:

Average speed = total distance / total time = 150 km / 3 hr = 50 km/hr.

Note:

Precision in units is critical here, and answers reinforce proper measurement practices.

5. Application and Critical Thinking Questions

Explanation:

These broader questions challenge students to interpret physics principles in real-life contexts, such as analyzing safety features in vehicles or predicting the motion of objects in space.

Sample question:

?Explain how seatbelts and airbags work together to protect passengers during a collision, based on Newton?s Laws.?

Answer insights:

The answer details how seatbelts increase the time over which a stop occurs (reducing force), and airbags cushion the impact, illustrating Newton?s second law in action.
